(External Examiner)
Sergey Lychagin, Assistant Professor at the Central European University, Research Fellow of the Applied Microeconomics Industrial Organization Economics of Education
(Internal Examiner)

The doctoral thesis is available for inspection
at the CEU Economics Department
Abstract

This thesis consists of three chapters: two single authored and one co-authored; each chapter investigates a different way in which varying forms of heterogeneity impact the effects of trade.

Chapter 1 presents a computable general equilibrium model that investigates the role trade liberalization has on skilled and unskilled wages. The model allows for endogenous skill formation as workers choose to become skilled or remain unskilled in response to new market conditions. I find that there is a substantial difference in how the skill premium changes depending on which sector is liberalized and on initial country conditions.

Chapter 2 also builds a computable general equilibrium model, investigating the welfare impact of EU institutions through free trade. I find that cross-sector input-output linkages play an important role in quantifying the gains from trade, which are orders of magnitude larger than what traditional models predict.

Chapter 3 is a joint work with Antoine Berthou and Emmanuel Dhyne, looking at the role firm heterogeneity has in estimating the elasticity of trade. The paper contains a theoretical model delivering sharp predictions which are then tested empirically against a novel dataset. We find that there is a substantial difference in elasticity between high and low productivity firms, as well as between sectors.

I provide more details on the contributions of the three chapters of the thesis below.

Chapter 1: Trade, the Skill Premium and Global Inequality

Chapter 1 investigates the role trade liberalization has on shaping both between and within country inequality. I build a Ricardian model in the spirit of Eaton and Kortum that features an arbitrary number of countries, capital-skill complementarity and four sectors each taking care of a different part of the production process. Within each country there are skilled and unskilled workers and whether a worker acquires education is determined endogenously given market prices and wages.

I calibrate the model to the year 2005 for a wide range of countries, both developing and developed and simulate a 10% symmetric drop in trade costs. I find there is a rich set of ways in which trade affects inequality.
I identify two opposing effects through which changes in trade costs influence inequality. First, as inputs become cheaper because of lower trade costs, firms will increase the demand for skilled workers due to capital-skill complementarity; however, as the consumption bundle is cheaper and acquiring education less costly, more workers may choose to become skilled increasing the supply. These two effects offset each other and which one dominates depends on country specific factors and which sector is liberalized.

Liberalizing capital goods increases inequality in developed countries and lowers it in poorer ones. Conversely, liberalizing foodstuff will increase inequality in developing countries the most.

Overall, my model does a good job replicating empirical patterns for several waves of trade liberalization. If workers can respond to the new economic conditions and the shares of skilled and unskilled labor can adjust, inequality may increase or decrease. However, the supply of labor must be free to adjust so trade liberalization should go hand in hand with encouraging school enrolment and other forms of training.

**Chapter 2: The European Union and the Gains from Trade**

In Chapter 2, I investigate the effect the EU had in increasing countries welfare through cheaper trade. I build a similar model to the one in Chapter 1 that I calibrate to the countries of the European Union. I examine the welfare gains by looking at two distinct facets of membership: joining the EU and using the Euro.

For the first scenario, I look at the 2004 enlargement wave. I estimate the changes in trade costs between 2003 and 2006 for trade between new and old members and then compute the changes in welfare, assuming that this had been the only shift in policy. I find that while gains are positive for all countries, new entrants gained significantly more than old members from enlargement, up to 5.5%. I break down total gains by transmission mechanism and find that allowing for interconnectedness across sectors significantly amplifies the changes in welfare.

In my second counterfactual, I ask what would have happened had Greek abandoned the Euro at the onset of its sovereign debt crisis in 2009. The losses due to higher trade costs would be around 2% of GDP. Greece being forced to have balanced trade would incur
another 1.5% in losses. Currency devaluation, while boosting external competitiveness, would further decrease welfare. Coupling depreciation with running a trade surplus would not incur considerable extra losses over the balanced budget scenario. However, these losses are measured in the best of possible worlds, abstracting from addition costs of default, public sector payment issues, social unrest, inflation or unemployment.

Chapter 3: Exchange rate movements, firm-level exports and heterogeneity

joint with Antoine Berthou and Emmanuel Dhyne

Chapter 3 looks at the role productivity heterogeneity has in firms’ exchange rate elasticity. We build a heterogeneous firms model where firms choose to export and set their price both domestically and abroad in terms of the exchange rate and the number of competing firms. In addition, firms source some of their inputs from abroad. The model delivers sharp predictions regarding the differences in elasticities between firms of varying productivities, between productive and unproductive sectors, between diverse and uniform sectors and between sectors that are reliant on intermediates from abroad and those that are not.

We test the model’s predictions using a novel dataset of highly disaggregated firm-based data for a panel of 11 European economies over 8 years. We find substantial variability in the exchange rate: more productive and more diverse sectors exhibit lower elasticities and the least productive firms are 3 times more sensitive to exchange rate movement that the most productive ones. We also find that the use of imported inputs explains a large part of exchange rate heterogeneity: sector with a large share of importing firms exhibit lower elasticity. We believe that the discrepancy between the responses of small and large firms provides some new light on the “International Elasticity Puzzle”.

WORK EXPERIENCE

2015 Jan – present
Information Analyst
University College London

2014 Jan – 2015 Jan
Research Assistant
Research Department, European Central Bank

2013 Sept – 2013 Dec
Visiting Researcher at the Centre for Economic Performance
London School of Economics, London, UK

2012 Aug – 2014 Apr
Research Assistant to Miklos Koren
Central European University, Budapest, Hungary

2012 Oct – 2013 Apr
Research Assistant to Adam Szeidl
Central European University, Budapest, Hungary

2011 Sept – 2013 Apr
Teaching Assistant, Graduate Level Macroeconomics
Central European University, Budapest, Hungary

EDUCATION

2010 – 2016
PhD in Economics
Supervisor: Miklos Koren
Central European University, Budapest, Hungary

2015 Dec
Advanced R programming
Royal Statistical Society, London, UK

2015 Apr
Day course in Data Visualisation
Farr Institute, London, UK

2014 Aug
Summer school in Multi-level Modelling
Vienna Joint Institute, Vienna, Austria

2011 Aug
Summer school in Solving DSGE models with heterogeneous agents and bounded rationality
London School of Economics, London, UK

2008 – 2010
Master degree in Corporate Finance and Insurance
Babes-Bolyai University, Cluj-Napoca, Romania

2005 – 2008
Bachelor Degree in Commerce, Tourism and Services
Babes-Bolyai University, Cluj-Napoca, Romania

DISTINCTIONS AND AWARDS

2013
Winner of the Olga Radzyner Award for the paper “The European Union and the Gains from Trade”, conferred by the Austrian Central Bank

2010 Sept – 2013 Aug
CEU Full Doctoral Scholarship
Central European University, Budapest, Hungary

2009
Winner Of Grand Prize At National Romanian research competition in Economics "Olimpiada Studenteasca"
2008 Sept – 2010 June
Romanian National Scholarship
Babes-Bolyai University, Cluj-Napoca, Romania

TOOLS AND SOFTWARE APPLICATIONS

Proficient
R (including graphics frameworks such as ggplot and Shiny), MATLAB, STATA, Microsoft Office Suite

Experienced
Python, SQL, STAN, Eviews, \LaTeX

Working knowledge
Spark, VBA, SPSS

SELECTED CONFERENCE PRESENTATIONS

2015 March CompNet Workshop, Madrid, Spain
2014 Sep CompNet Workshop, Lisbon, Portugal
2014 Jun CompNet Workshop, Frankfurt, Germany
2014 Feb 7th RGS Doctoral Conference in Economics, Dortmund, Germany
2013 Sept 13th European Trade Study Group, Birmingham, United Kingdom
2013 May Spring Meeting of Young Economists, Aarhus, Denmark
2012 Sept 12th European Trade Study Group, Leuven, Belgium
2012 June 4th Economic Challenges in Enlarged Europe, Tallinn, Estonia
